AB To study the function of **acyl-CoA oxidase** in an n-alkane-assimilating yeast, **Candida maltosa**, the authors isolated the POX2 gene which is a member of the **acyl-CoA oxidase** gene family. POX2 had a 2172-bp open reading frame (ORF) encoding an approx. 84-kDa polypeptide (724 amino acids (aa)) and was contiguous to POX4, another member of the **acyl-CoA oxidase** gene family on the same chromosomal DNA in a convergent arrangement. Northern blot anal. revealed that the expression of POX2 was induced in cells grown on oleic acid, n-tetradecanol and n-tetradecane. By using a gene-disruption technique, the authors constructed strains (termed P2DD and P4DD) in which both alleles of POX2 and POX4 were disrupted. The P2DD strain was normal in assimilation of various hydrophobic carbon sources, such as n-tetradecane, n-tetradecanol and oleic acid. In contrast, the P4DD strain was defective in its ability to grow on such hydrophobic carbon sources.

CODEN: ABCHA6; ISSN: 0002-1369
DOCUMENT TYPE: Journal
LANGUAGE: English

AB The genes POX2 and POX4, which encode the subunits (PXP-2 and PXP-4) of peroxisomal fatty acyl-CoA oxidase of C. tropicalis, were introduced into the related yeast C. maltosa. The cells transformed with POX2 or POX4 showed high level expression of PXP-2 or PXP-4 in the purified peroxisomes. The polypeptides assocd. with the heterologous organelle were resistant to added protease, implying that they were transported into the peroxisomes. Truncated genes for PXP-4 were constructed in vitro and introduced into the host cells. Peptide-C, the COOH-terminal two-thirds of PXP-4, was efficiently transported into the host peroxisomes, and the polypeptide contg. the NH2-terminal one-third was also, in much lesser amt. These and other results suggested that there were at least 2 regions of peroxisomal targeting information in PXP-4 and the primary information was internal. Deletions in Peptide-C inhibited the transported of many, but not all, of the host-cell peroxisomal polypeptides. This suggested the existence of heterogeneous transport systems on the peroxisomal membrane.

AB Acyl CoA oxidase (I) [61116-22-1] is produced by culturing yeast (esp. Candida), fungi, or Streptomyces. Thus, C. maltosa IAM 12247 was cultured with shaking at 30.degree. for 24 h on a medium (pH 5.2) contg. n-alkane mixt. 1, (NH4)H2PO4 0.5, KH2PO4 0.25, MgSO4 0.1, and yeast ext. 0.25%. The cells (22 g) were suspended in 50 mM phosphate buffer (pH 7.2) and disintegrated with a Dyno mill. The homogenate was mixed with (NH4)2SO4 at 45% satn. and centrifuged. The resulting ppt. was extd. with 50 mM phosphate buffer (pH 7.2) contg. 0.5% Triton X-100. The ext. was subjected to column chromatog. on Sephadex G-25 and DEAE-cellulose to yield 150 mg yellow powd. I.

NiceZyme View of ENZYME: EC 1.6.2.4

Official Name

NADPH--ferrihemoprotein reductase.

Alternative Name(s)

NADPH--cytochrome p450 reductase.
TPNH(2) cytochrome c reductase.
Ferrihemoprotein p450 reductase.

Reaction catalysed

```
    NADPH
  + 2 ferricytochrome
<=>
    NADP(+)
  + 2 ferrocytochrome
```

Cofactor(s)

FMN; FAD.

Comments

- Catalyses the reduction of heme-thiolate-dependent monooxygenases such as EC 1.14.14.1, and is part of the microsomal hydroxylating system.
- Also reduces cytochrome b5 and cytochrome c.

BRENDA:1.14.14.1

E.C. number	1.14.14.1 (BRENDA copyright notice)
Original Organism	#1# Mammals (e.g. mouse <1, 2>; rabbit <3>. There is no clear evidence whether the enzymes isolated from microsomes of different species, or even from the same species by different research groups are identical) <1-3>
Systematic name	Substrate,reduced-flavoprotein:oxygen oxidoreductase (RH-hydroxylating or-epoxidizing)
Recommended name	Unspecific monooxygenase
Synonyms	Microsomal monooxygenase EC 1.99.1.1 (formerly) EC 1.14.99.8 (formerly) EC 1.14.1.1 (formerly) Microsomal P-450 Aryl hydrocarbon hydroxylase Aryl-4-monooxygenase Xenobiotic monooxygenase Flavoprotein-linked monooxygenase Flavoprotein monooxygenase Oxygenase, flavoprotein-linked mono- EC 1.14.14.2 (formerly)
CAS registration number	62213-32-5
Reaction	RH + reduced flavoprotein + O2 = ROH + oxidized flavoprotein + H2O
Reaction type	Deamination Desulfation Epoxidation Hydroxylation N-, S-, O-Dealkylation N-Oxidation Redox reaction Reduction of azo, nitro, N-oxide groups Sulfoxidation

Substrates/products	S: Aryl hydrocarbons + reduced flavoprotein + O2 #1# (e.g. benzo[a]pyrene, ethoxyresuforin, biphenyl, p-nitroanisole, acetanilide, 2-acetylaminofluorene, 2-ethoxycoumarin, estradiol-17beta, testosterone, #1# <1, 2>; prostaglandins, #1# <3>) <1-3> P: ? S: More #1# (acts on a wide range of substrates including many xenobiotics, steroids, fatty acids, vitamins and prostaglandins. Depending on the procedure of induction and chromatography numerous forms of enzyme can be isolated. Up to now there is no clear evidence whether a special form of P-450 exists for each of the different reaction types, or several nonspecific enzymes catalyze more than 1 reaction. The enzymes from different organisms and from different tissues of a single organism are not comparable, those described in, #1# <1-3> display only a small part of a wide spectrum of possible reactions) <1-3> P: ?
Source tissue	Liver #1# <1-3>
Localisation	Microsomes #1# (16 different cytochrome P-450 have been isolated from mouse liver of which each contains numerous different forms of P-450) <1, 2>

BRENDA:1.14.14.1 Mammals

E.C. number	1.14.14.1 (BRENDA copyright notice)
Original Organism	Mammals (e.g. mouse <1,2>; rabbit <3>; . There is no clear evidence whether the enzymes isolated from microsomes of different species, or even from the same species by different research groups are identical) <1-3>

Substrates/products	S: Aryl hydrocarbons + reduced flavoprotein + O2 (e.g. benzo[a]pyrene, ethoxyresuforin, biphenyl, p-nitroanisole, acetanilide, 2-acetylaminofluorene, 2-ethoxycoumarin, estradiol-17beta, testosterone <1,2>; prostaglandins <3>) <1-3> P: ? S: More (acts on a wide range of substrates including many xenobiotics, steroids, fatty acids, vitamins and prostaglandins. Depending on the procedure of induction and chromatography numerous forms of enzyme can be isolated. Up to now there is no clear evidence whether a special form of P-450 exists for each of the different reaction types, or several nonspecific enzymes catalyze more than 1 reaction. The enzymes from different organisms and from different tissues of a single organism are not comparable, those described in <1,2,3>; display only a small part of a wide spectrum of possible reactions) <1-3> P: ?
Source tissue	Liver <1-3>
Localisation	Microsomes (16 different cytochrome P-450 have been isolated from mouse liver of which each contains numerous different forms of P-450) <1, 2>

NiceZyme View of ENZYME: EC 1.14.14.1

Official Name

Unspecific monooxygenase.

Alternative Name(s)

Microsomal monooxygenase.
Xenobiotic monooxygenase.
Aryl-4-monooxygenase.
Aryl hydrocarbon hydroxylase.
Microsomal p450.
Flavoprotein-linked monooxygenase.
Cytochrome p450.

Reaction catalysed

```
    RH
  + reduced flavoprotein
  + O(2)
<=>
    ROH
  + oxidized flavoprotein
  + H(2)O
```

Cofactor(s)

Heme-thiolate.

Comments

- Acts on a wide range of substrates including many xenobiotics, steroids, fatty acids, vitamins and prostaglandins.
- Reactions catalysed include hydroxylation, epoxidation, N-oxidation, sulfooxidation, N-, S- and O-dealkylations, desulfation, deamination, and reduction of azo, nitro, and N-oxide groups.

BRENDA:1.3.3.6

E.C. number	1.3.3.6 (BRENDA copyright notice)
Original Organism	#1# Spinacia oleracea (spinach) <20> #2# Vigna radiata (mung bean) <20> #3# Phanerochaete chrysosporium <21> #4# Cucumis sativus (cucumber) <22> #5# Candida tropicalis (pK 233) <1, 13-16> #6# Rat (3 forms: 1. inducible fatty acyl-CoA oxidase, 2. noninducible fatty acyl-CoA oxidase, 3. noninducible trihydroxycoprostanoyl-CoA oxidase <11>) <2-4, 6-11> #7# Candida lipolytica <5> #8# Candida maltosa <18> #9# Human <12> #10# Saccharomyces cerevisiae <17> #11# Mouse <19>
Systematic name	Acyl-CoA:oxygen 2-oxidoreductase
Recommended name	Acyl-CoA oxidase
Synonyms	Oxidase, acyl-coenzyme A Fatty acyl-CoA oxidase Acyl coenzyme A oxidase Fatty acyl-coenzyme A oxidase
CAS registration number	61116-22-1
Reaction	Acyl-CoA + O2 = trans-2,3-dehydroacyl-CoA + H2O2 (acts on CoA derivatives of fatty acids with chain length from 8 to 18)
Reaction type	More #7# (anti-elimination of pro-2R and pro-3R hydrogens of acyl-CoA) <5> Redox reaction
Substrates/products	S: Lauroyl-CoA + O2 #1,2,5,6# <6, 13, 15, 20> P: trans-2-Dodecenoyl-CoA + H2O2 S: Arachidoyl-CoA + O2 #5# <13> P: trans-2,3-Dehydro-5,8,11,14-eicosatetraenoyl-CoA + H2O2 S: Dec-4-cis-enoyl-CoA + O2 #6# <3> P: ? S: 2-Oxoheptadecyldethio-CoA + O2 #5# <14>

P: ?

- S: Dicarboxylic acid-CoAs with 6-16 carbon atoms + O2 #6# <10>
  P: ?
- S: Butyryl-CoA + O2 #1,2# (not, #3,6# <9, 21>) <20>
  P: trans-2-Butenoyl-CoA + H2O2

Purification	#4# (cucumber) <22> #5# <13, 15> #6# <6, 8, 9>
Crystallisation	#5# <13>
Molecular Weight	600000 #5# (Candida tropicalis, sedimentation equilibrium) <13> 552000 #5# (Candida tropicalis, ultracentrifugation) <15> 427000 #6# (rat liver, noninducible fatty acyl-CoA oxidase, gel filtration) <11> 150000 #4# (Cucumis sativus, gel filtration) <22> 145000 #6# (rat liver, inducible fatty acyl-CoA oxidase, gel filtration) <11> 139000 #6# (rat liver, sedimentation equilibrium method <6>; noninducible trihydroxycoprostanoyl-CoA oxidase <11>) <6, 11>
Subunits	Dimer #4,6# (2 * 71000, rat liver, SDS-PAGE, noninducible fatty acyl-CoA oxidase <11>; 2 * 72000, Cucumis sativus, SDS-PAGE <22>) <11, 22> Hexamer #6# (6 * 69000, rat liver, SDS-PAGE, noninducible trihydroxyprostanoyl-CoA oxidase) <11> Octamer #5# (8 * 74000 <13>; 8 * 75000 <14>; Candida tropicalis, SDS-PAGE <13, 14>) <13, 14> Oligomer #5,6# (x * 72100, Candida tropicalis, SDS-PAGE <15>; x * 52000, x * 22500, rat liver, SDS-PAGE, inducible fatty acyl-CoA oxidase <11>) <11, 15> Tetramer #6# (2 * 45000 + 2 * 22000, rat, SDS-PAGE) <8>
Cloned	#5,6# (Candida tropicalis pK 233 <1>; rat <2>) <1, 2>
pH-stability	5.5-9 #5# (35°C, 60 min) <13>

Temperature stability (deg.C)	65 #5# (10 min, complete inactivation) <13> 50 #5# (10 min) <13>
General stability	#4# Dialysis, 4°C, 24 h, 80% loss of activity <22>
Storage stability	#5# -20°C, 25% glycerol, 8 months <15> #6# -20°C, for at least 1 month <6> #5# -20°C, pH 7.4, 2 months <14> #5# 4°C, pH 7.4, 2 months, 20% loss of activity <14> #4# Frozen, 10% sucrose, several weeks <22>
